The revolution of information and telecommunication technologies, which started since the mid 1990s, has triggered unprecedented flows of capital, people, goods, and information between cities around the world and cities of the global south are not an exception. Many cities are acquiring geostrategic importance, positioning themselves as connected, competitive, and desirable places to attract transnational practices, international investment, and diversity economies. Within this new world order cities in the global south have experienced dramatic urban transformations that instigated critical questions about regenerating and retrofitting cities, international connectivity, international attractiveness, and the quality of urban life, among others.

For this issue of Open House International interested scholars, academics, and practitioners are invited to submit expression of interests to the guest editors. Contributions must address cities and contexts in Africa, South America, South East Asia, or the MENA region. Issues of interest include:

- Representation, spectacles, and global city image
- Culture, lifestyles, and transformations in housing typologies
- Livability, diversity, and quality of urban life
- Regeneration and sustainable urban conservation
- Socio-cultural/socio-economic sustainability and the right to the city
- Squatter settlements and informal urbanism
- Gated communities and cities within cities
- The spatial practice of migrant communities
